**BEFORE THE PUBLIC UTILITIES COMMISSION
OF THE STATE OF CALIFORNIA**

Order Instituting Rulemaking to Update
Distribution Level Interconnection
Rules and Regulations.

Rulemaking 25-08-004
(Filed August 14, 2025)

**COMMENTS OF THE VEHICLE-GRID INTEGRATION COUNCIL ON ORDER
INSTITUTING RULEMAKING TO UPDATE DISTRIBUTION LEVEL
INTERCONNECTION RULES AND REGULATIONS**

In accordance with the Rules of Practice and Procedure of the California Public Utilities Commission (“Commission”), the Vehicle-Grid Integration Council (“VGIC”) hereby submits these comments on the *Order Instituting Rulemaking to Update Distribution Level Interconnection Rules and Regulations* (“OIR”), issued on August 20, 2025.

I. INTRODUCTION.

VGIC appreciates the opportunity to provide comments on the OIR to Update Rule 21. VGIC strongly supports the Commission’s intent to modernize Rule 21 and ensure that interconnection processes remain efficient, transparent, affordable, and equitable as California transitions toward the use of more distributed energy resources (“DER”). In particular, VGIC urges the Commission to prioritize reforms that enable bidirectional electric vehicle (“EV”) charging customers to interconnect safely, affordably, and in a manner that supports grid reliability. Accordingly, VGIC offers recommendations on the proposed scope, process, and schedule for this proceeding.

II. BACKGROUND & INTEREST IN PROCEEDING.

VGIC is a 501(c)6 member-based advocacy group committed to advancing the role of EVs and vehicle-grid integration (“VGI”) through policy development, education, outreach, and

research. VGIC supports the transition to a decarbonized transportation and electric sector by ensuring the value from flexible EV charging and discharging is recognized and compensated to achieve a more reliable, affordable, and efficient electric grid. VGIC's members include automotive original equipment manufacturers ("OEMs"), EV service providers ("EVSPs"), DER aggregators, EV charging site developers, publicly owned electric utilities, and Community Choice Aggregators.

In D.20-09-035, the Commission clarified that direct current ("DC") bidirectional EV charging systems are a form of energy storage for the purposes of interconnecting under Rule 21. The Commission has also directed the investor-owned utilities ("IOUs") to establish pathways to interconnect alternating current ("AC") bidirectional charging systems outside of the Rule 21 process. Lastly, the Commission has detailed next steps for incorporating AC bidirectional charging systems into Rule 21, pending certain milestones completed by standards development organizations. VGIC, therefore, holds a direct interest in modifications to Rule 21 interconnection processes. VGIC has been an active party in the predecessor rulemaking on Rule 21, R.17-07-007, and related rulemakings on transportation electrification and distributed energy resources, such as R.18-12-006, R.21-06-017, and R.23-12-008.

III. COMMENTS ON THE PROPOSED SCOPE.

VGIC appreciates the Commission's effort to consider the multitude of items that can be improved in Rule 21. Below, VGIC offers the following recommendations for additional items that should be included or excluded from the scope of this proceeding.

A. ITEMS TO ADD TO SCOPE.

a. Reassess Application Fees for Small Non-NEM and Non-NBT Systems.

VGIC recommends that the Commission revisit Rule 21 interconnection application fees for small systems that are not enrolling in Net Energy Metering (NEM) or the Net Billing Tariff (NBT). The previous Rule 21 proceeding (R.17-07-007) explicitly included this question in scope but did not resolve it. VGIC recommends that the questions below from R.17-07-007 be added to the scope of this new OIR under *Topic 5: Tariff Implementation Costs* or as a stand-alone issue within the first phase of this proceeding:

- “Should the Commission revise the application fee for non-net energy metering systems? How should the Commission determine what the revised fee should be?”

VGIC is concerned that the interconnection fee of \$800 for all non-NEM and non-NBT exporting systems are disproportionately high and not reflective of actual utility costs. Notably, these fees significantly exceed those charged by utilities in other states, in most cases by 800%.¹ Additionally, these fees have an outsized impact on bidirectional charging systems, which have relatively lower upfront costs compared to stationary energy storage systems, rooftop solar PV, or other DERs interconnecting under Rule 21. Since customers are purchasing EVs for transportation uses, the incremental costs to unlock bidirectional capabilities is typically only the cost of the bidirectional charger and interconnection. As a result, the \$800 interconnection application fee comprises one of the most significant upfront costs for bidirectional charging systems and, in turn, a significant barrier to widespread bidirectional charging system deployment. These deployments can support grid reliability, ratepayer affordability (including

¹ See Attachment A for a list of national utility interconnection fees compiled by VGIC and members.

for non-EV customers), and efficiency through customer participation in a rate or program, such as the Emergency Load Reduction Program, the California Energy Commission’s (“CEC”) Demand Side Grid Support (“DSGS”) program, Pacific Gas and Electric’s (“PG&E”) Vehicle-to-Everything (“V2X”) Residential or Commercial Pilots, PG&E’s Hourly Flex Pricing pilot, Southern California Edison’s (“SCE”) expanded dynamic rate pilot, San Diego Gas & Electric’s (“SDG&E”) Export Compensation Pilot, and/or SCE’s proposed Vehicle-to-Grid Resource Proposal. These deployments can also help customers, including school bus fleets, municipal fleets, and small business fleets, manage bills through non-exporting, grid-parallel bidirectional charging system configurations designed to mitigate demand charges or energy consumption.

b. Interconnection Application Form and Portal Updates for Bidirectional EV Charging Systems.

VGIC strongly recommends that the scope of this proceeding consider interconnection application form and portal updates, specifically for bidirectional charging system Rule 21 applications, to ensure that customers can interconnect efficiently without confusion. VGIC recommends that the following items be added to *Topic 2: Interconnection Processes*:

- What updates are needed to ensure each IOU’s interconnection application and portal include clear interconnection guidance and process for bidirectional EV charging systems?

To avoid confusion and delay, it is critical that each IOU’s interconnection application forms and online portal, if available, allow applicants to clearly identify whether an energy storage system is a bidirectional EV charging system. This update, detailed although ultimately not directed in Decision (D.) 20-09-035 *Issue 23f*, is now more relevant as bidirectional EV charging system interconnection requests have increased in the five years since the Working Group Three

report was submitted. Furthermore, applicants should be able to specify the technology type (e.g., AC or DC), as this can expedite utility review.

The IOUs have made some progress on this issue, but navigating all the IOU interconnection portals continues to be confusing for bidirectional EV charging system applicants. SCE and SDG&E do not have clear bidirectional charging system interconnection application forms. PG&E does have dedicated forms, but customers aiming to be compensated for exports under PG&E's V2X Residential or Commercial Pilots must, confusingly, indicate that they are a non-export application. The lack of appropriate forms has also led to confusion for utility employees, with VGIC members reporting instances of bidirectional EV charging system interconnection applications being routed out of the Rule 21 process to an energization make-ready program or tariff (i.e., Rule 29/45). Consistent, standardized processes are essential to enable bidirectional EV charging system project development and avoid unnecessary delays.

Lastly, per D.20-09-035, the IOUs must circulate quarterly interconnection timeline reports showing the date by which certain interconnection milestones are reached for Rule 21 DERs. The current quarterly reports are sortable by technology type. However, the three major IOUs use different terminology for bidirectional charging systems and, in some cases, do not report the bidirectional charging system requests, despite each IOU having known bidirectional charging sites. VGIC recommends the Commission include standardized quarterly interconnection timeline reporting for bidirectional charging systems in the scope of this proceeding under *Topic 2: Interconnection Processes*.

c. Defining a timeline or roadmap for transitioning to virtual inspection and notification-only approaches for non-NEM and non-NBT resources.

VGIC recommends that a new scoping topic be added on interconnection process streamlining, which would include timelines for the development of virtual inspection and

notification-only approaches in Rule 21. Virtual inspections and notification-only approaches both offer cost and time improvements over traditional site inspection processes, especially for smaller bidirectional charging system projects. Establishing a clear timeline and milestones for this transition will streamline interconnection processes and reduce burdens on applicants. For example, the Commission could consider adopting a threshold number of bidirectional charging site interconnections that would trigger the establishment of a virtual inspection process. VGIC therefore recommends adding a new topic to the OIR on streamlining with the following questions:

- What milestones and timelines should the Commission adopt for implementing virtual inspection and notification-only approaches for non-NEM and non-NBT projects? What procedural processes should be established to ensure that these issues can be taken up in a timely manner in the future?
- What technical or safety conditions should be considered when determine eligibility for virtual inspection or notification-only interconnection?
- How can the Commission ensure that these processes evolve with market maturity?

Currently, all three utilities leverage virtual inspections to a certain extent to streamline interconnection, particularly for NEM and NBT systems. However, field inspections are still required typically for projects using relays, AC disconnects, NGOMs, and variances from Rule 21. Meanwhile, the currently-approved notification-only pilot was available through September 2025 and was only open to non-export standalone storage or solar-plus-storage projects less than 30 kVA capacity.²

VGIC acknowledges that the bidirectional charging market may not currently be mature enough to justify these approaches. However, we recommend that the scope of this proceeding

² Resolution E-5311.

establish certain milestones or explicit timelines for when both issues should be taken up in the initial Scoping Memo. VGIC advises against subjecting these issues to the organic cycles of scoping new Rule 21 issues – as evident in Phase II of R.17-07-007, unexpected events can lead to delays of 4-5 years, even for already scoped, time-sensitive matters. Instead, VGIC recommends that this proceeding add a topic to consider what milestones (e.g., a certain number of deployments) or timelines (e.g., a certain date for implementation) are appropriate to implement virtual inspection and, subsequently, notification-only approaches. For example, the V2G AC pilot was approved in D.20-09-035 and Resolution E-5315. In the Resolution, the Commission acknowledged that it was premature to set permanent Rule 21 V2G AC standards but outlined a concrete process for updating Rule 21 once V2G AC technical standards are in place, which will involve the reconvening of a working group and the submission of a Tier 3 Advice Letter to update Rule 21.³ VGIC envisions a similar process roadmap being outlined for virtual inspection and notification-only streamlining, wherein a specific milestone, like number of sites deployed, is adopted that would trigger subsequent Commission action.

d. Updating Rule 21 technical provisions for all storage devices and bidirectional EV charging systems.

VGIC recommends that *Topic 3: Interconnection Pathways and Standards* add a question to discuss any needed updates to Rule 21 to accommodate the wide variety of DERs now available to customers, including bidirectional EV charging systems. With the large-scale and relatively rapid adoption of solar in the state over the previous two decades, Rule 21 has adopted many changes that are designed to serve that technology specifically. Therefore, some items in Rule 21

³ Resolution E-5315.

might not be fully applicable to less adopted technologies like bidirectional EV charging systems. A more comprehensive review of requirements should be considered in scope for this proceeding.

Currently, the OIR contains a question on technical updates to Rule 21 for non-export systems. This question also insinuates that these systems are creating “challenges”, which might not be the case. Instead, VGIC recommends that this question be modified to address true technical differences for both export and non-export resources:

- Do new technologies for ~~non-exporting~~ storage systems, including ~~non-exporting vehicle-to-grid (V2G) bidirectional EV charging systems, for electric vehicle charging stations and home and building backup power, pose new challenges for interconnection~~ introduce new technical considerations or unique characteristics that merit consideration of changes to Rule 21 for these technologies?

Revisiting these technical requirements to align with modern capabilities will allow DERs, including bidirectional EV charging systems, to interconnect safely and efficiently.

B. ITEMS TO REMOVE FROM SCOPE.

- a. Interconnecting customers should not be responsible for upgrade costs caused by a sustained or permanent reduction in customer service loads.**

VGIC strongly recommends removing questions related to the Responsibility for Upgrade Costs Due to Load Reduction from this proceeding entirely. It is unclear why the Commission is pursuing this issue in Rule 21 at this time, given that load reduction does not trigger significant distribution upgrades and paying for load reduction is fundamentally antithetical to California’s view of load reduction.

The OIR references Resolution E-5296 and the discussion on sustained load reduction. But that Resolution noted that sustained load reduction is not a significant cost concern. The Commission states:

We further take note of the statement by IREC, that in response to a data request by IREC to the Large IOUs, **the Large IOUs indicated that they were not aware of even a single incident in the last five years in which a distribution system violation occurred due to sustained reduction in load.** Given this response, we find that sustained reductions in load, while certainly possible, remain somewhat speculative. **We can't say such load reductions won't happen, but are swayed by IREC's argument that the likelihood appears low, particularly given California's electrification mandates.**⁴

VGIC is unaware of any significant changes in circumstances that have occurred since the Commission adopted Resolution E-5296 in March 2024. In fact, the Commission notes that the utilities should revisit the potential issue of sustained load reduction associated with systems utilizing Limited Generation Profiles ("LGP") three years after LGP options become available to customers, which would be in mid-2028.⁵ Without any data, it is premature and inappropriate to adopt processes for determining the need for upgrades triggered by a sustained or permanent reduction in customer loads, and even more premature to discuss the appropriate cost recovery mechanisms. Given the expected load growth in the state, VGIC anticipates that upgrades due to load reduction will be particularly significant. Limited stakeholder resources are therefore better spent on the many other pressing topics in this proceeding.

More importantly, charging customers for reducing their electricity demand, whether through energy efficiency measures, self-generation, or other means, would also be a significant departure from the long-standing regulatory principles that promote customer choice and efficient energy use. California's energy policy framework has consistently encouraged energy efficiency and load reduction as a public good, not a cost burden, because it advances decarbonization, reduces system strain (including peak demand) and lowers overall capacity procurement costs. Penalizing customers for not continuing to procure power from utilities at historic levels would

⁴ Resolution E-5296 at 34.

⁵ Resolution E-5296 at Finding 37.

effectively treat them as obligated “sinks” for utility sales rather than as customers paying for services received. Moreover, customer load reductions occur for many reasons outside of the installation of Rule 21 generators, including energy efficiency upgrades or pure operational changes or business closures, and no customers are currently charged for grid upgrades that might result from those decisions. If the Commission is concerned about the costs of load reduction, it should be discussed in a venue where all types of load reduction can be considered and where cost recovery can be discussed more broadly. This general discussion should not be in the scope of a proceeding focused on Rule 21.

IV. PROCEDURAL SCHEDULE, CATEGORIZATION, AND NEED FOR HEARINGS.

VGIC appreciates that the OIR recognizes the need for a comprehensive update to Rule 21. However, given the breadth of topics under consideration and the Commission’s experience with delayed resolution of critical interconnection issues, VGIC respectfully urges the Commission to establish a procedural schedule structured around timely progress through parallel tracks and targeted interim decisions.

The prior Rule 21 proceeding (R.17-07-007) addressed numerous technical and policy issues in large, multi-topic decisions spanning hundreds of pages of discussion, resulting in long delays and interdependencies between wholly unrelated subjects. For example, delays in finalizing Limited Generation Profiles led to suspension of the entire proceeding in 2022, which has delayed progress on urgent interconnection matters until the opening of this OIR in 2025. To avoid a repeat of these challenges, the Commission should establish multiple concurrent tracks that allow independent advancement of issues based on their complexity and urgency and, in turn, timely conclusion via more manageable, targeted Commission decisions.

VGIC also strongly recommends that there be an early Track 1 dedicated to Interconnection Application Fee Reform and Interconnection Process Improvements, as these constitute urgent issues for bidirectional charging systems, which have not experienced the degree of stakeholder focus historically afforded to rooftop solar and stationary energy storage. This track should focus on near-term issues that can lead to tangible interconnection improvements and be resolved within the next 9-12 months. These would include application fee reform for non-NEM systems and the questions in Topic 2 on interconnection processes, particularly for interconnection application form and portal updates.

VGIC supports the categorization of this proceeding and agrees with the preliminary determination that hearings will not be necessary.

V. NOTICES.

Service of all notices and communications in this proceeding should be directed to the following VGIC representative:

Zach Woogen
Executive Director
Vehicle-Grid Integration Council
1401 21st St., Suite 5409
Sacramento, California 95811
Telephone: (510) 665-7811
Email: vgicregulatory@vgicouncil.org

VI. CONCLUSION.

VGIC appreciates the opportunity to provide these comments on the OIR. We look forward to further collaboration with the Commission and stakeholders on this initiative.

Respectfully submitted,

/s/ Zach Woogen
