Joint Letter on Managed Charging in Formal Case No. 1167

The undersigned parties appreciate the opportunity to submit these comments regarding managed charging in DC. We collectively support the introduction of advanced load management programs in the District, specifically Electric Vehicle (EV) managed charging, as a practical near-term tool to advance the District's climate goals while maintaining reliability and affordability.

To ensure the District meets its climate goals while maintaining a reliable and affordable grid, we urge the Commission to approve Pepco's proposed Schedule R-EV-TOU and encourage the rapid development of a Smart Charge Management (SCM) program.

Support for Schedule R-EV-TOU: A Critical First Step

On January 30, 2026, Pepco filed a proposal for an EV-only Time-of-Use (TOU) rate. We believe this proposal is an essential "Phase 1" for managed charging in DC for several reasons.

- **Customer Savings:** The proposal offers a 3-cent-per-kWh credit, saving a typical EV driver who uses approximately 250 kWh per month about \$90 annually.
- **System Benefits:** This rate design provides price signals to encourage off-peak charging, creating a more efficient electric system.
- **Proven Success:** Similar rates in Maryland have resulted in 97% of charging occurring during off-peak periods.¹
- **Low Cost of Adoption:** By utilizing vehicle telematics and networked chargers, this program avoids the need for customers to install expensive second meters.

The Case for Smart Charge Management

While TOU rates help shift load from peak periods, they do not protect the local distribution system. We encourage Pepco to follow this filing with a Smart Charge Management (SCM) program, a model already successfully being operated by Pepco, Baltimore Gas and Electric, and Delmarva Power in Maryland.

Residential EV charging can significantly strain local infrastructure, particularly secondary transformers. Transformers rated at or below 50 kVA can be overloaded by

¹ BGE Semi-Annual Progress Report for the period of July 1, 2025 through December 31, 2025 filed in Case No. 9478 on February 2, 2026

only a few EVs charging simultaneously. SCM actively manages charging at the secondary transformer and feeder level to prevent these overloads and extend the life of distribution assets.

The economic value of optimizing charging for the distribution grid is well-documented. We draw the Commission's attention to two key studies:

Argonne National Lab (ANL): In an analysis of managed charging in Maryland, ANL and the Smart Energy Power Alliance (SEPA) estimated roughly \$300 per EV-year in downstream distribution benefits alone by deferring necessary transformer and feeder upgrades.²

The Brattle Group: A recent report found that annual utility system benefits from distribution-optimized managed charging could reach \$400 per EV compared to unmanaged charging. Brattle also estimated \$200 in annual distribution savings, specifically when comparing distribution-optimized active managed charging to TOU-based charging alone (such as R-EV-TOU).³

Conclusion

The economic and environmental benefits of these programs for DC households are clear. We respectfully request that the Commission approve Schedule R-EV-TOU and encourage Pepco to file for an SCM program in DC. We look forward to continued engagement and thank the Commission for consideration of these comments.

Thank you,

The Alliance for Automotive Innovation represents the full auto industry value chain, including the manufacturers producing most vehicles sold in the U.S., equipment suppliers, battery producers, semiconductor makers, technology companies, and autonomous vehicle developers. Our mission is to work with policymakers to realize a cleaner, safer, and smarter transportation future and to ensure a healthy and competitive auto industry that supports U.S. economic and national security.

General Motors LLC, headquartered in Detroit, MI, is a global automotive manufacturer leading the development of groundbreaking technologies that further its vision of zero crashes, zero emissions, and zero congestion. Our automotive operations meet the demands of our customers with vehicles developed, manufactured, and/or marketed under the Buick, Cadillac, Chevrolet, and GMC brands.

VGIC is a 501(c)6 membership-based advocacy group committed to advancing the role of vehicle-grid integration (“VGI”) through policy development, education, outreach, and research. VGIC supports the transition to a decarbonized transportation and electric sector by ensuring that the value of flexible EV charging and discharging is recognized and compensated, thereby achieving a more reliable, affordable, and efficient electric grid.

WeaveGrid is a software company that helps utilities increase the adoption of electric vehicles and other distributed resources (e.g., residential batteries) through greater understanding of customer charging behaviors, managed charging programs, and distribution-level optimization.
