RE: Case 18-E-0138 – Proceeding on Motion of the Commission Regarding Electric Vehicle Supply Equipment and Infrastructure

Notice of Errata

The Vehicle-Grid Integration Council (“VGIC”) submits this Notice of Errata to correct and replace a paragraph appearing on pages 5–6 of its July 17, 2026 comments concerning the tradeoffs of OEM-authorized and customer-authorized telematics pathways.

Upon further review, VGIC determined that several statements were inaccurate, namely that we had mischaracterized the findings of the cited *Technical Standards Working Group Report Addressing Electric Vehicle Supply Equipment and Telematics Accuracy* and conflated these findings with the related *Methodology for Testing the Accuracy of Data Collected from Managed Charging Enabling Technologies* report created by EPRI and filed by the Joint Utilities in September 2024. The TSWG Report did not compare OEM-authorized and customer-credential-based pathways. The original language does not accurately reflect the evidence available to VGIC.

VGIC therefore deletes the paragraph beginning “These tradeoffs include the benefits and costs of OEM-authorized telematics,” appearing on pages 5–6 of its July 17, 2026 comments, and replaces it in its entirety with the following:

~~“These tradeoffs include the benefits and costs of OEM-authorized telematics vs customer-authorized telematics. These approaches may be suitable for different use cases, depending on the access to and fidelity of the collected data. As such, the JU and Commission should continue detailing the appropriate use cases and tradeoffs for OEM-authorized telematics vs customer-authorized telematics. Although there is some variation among them, OEM-authorized telematics are generally based on defined data schemas, data collection methods, and error handling expectations. Customer-authorized telematics rely on customer credentials and endpoints designed to leverage existing consumer apps. Both pathways share commonalities, as detailed in the *Technical Standards Working Group Report Addressing Electric Vehicle Supply Equipment and Telematics Accuracy* (TSWG Report), filed September 2, 2025. First, both pathways leverage the same underlying telematics data sources, though they may be structured~~

~~differently. Second, the vehicle telematics data sources, in general, were not historically purpose-built to support managed charging programs or utility use cases. Third, it is clearly possible to address certain errors or gaps in the underlying telematics data by processing it to make it suitable for use in a managed charging program or utility use cases.”~~

“These tradeoffs include the benefits and costs of OEM-authorized telematics vs customer-credential-based telematics. These approaches may be suitable for different use cases, depending on the access to and fidelity of the collected data, as well as the functionality, security, and operational requirements of the program. As such, the JU and Commission should continue detailing the appropriate use cases and tradeoffs for OEM-authorized telematics vs customer-credential-based telematics. Although there is some variation among them, OEM-authorized telematics are generally based on defined data schemas, access permissions, data collection methods, error-handling expectations, and change-management processes. Customer-credential-based telematics rely on customer credentials and endpoints designed to leverage existing consumer apps. The *Methodology for Testing the Accuracy of Data Collected from Managed Charging Enabling Technologies* (EPRI Report), filed September 12, 2024, evaluated both “OEM-provided” and “third-party hosted” telematics data, but did not compare OEM-authorized and customer-credential-based access models. The EPRI Report found that telematics performance may vary based on factors including measurement methods, session duration, auxiliary loads, and provider-applied adjustments.¹ Additionally, it is clear to VGIC based on the data in the EPRI Report that it is possible to address certain errors or gaps in the underlying telematics data by processing it to make it suitable for use in a managed charging program or utility use cases.”²

Except as corrected above, VGIC’s July 17, 2026 comments remain unchanged.

Respectfully submitted,

Zach Woogen

¹ *Methodology for Testing the Accuracy of Data Collected from Managed Charging Enabling Technologies*. EPRI. 2024. Page 9. <https://documents.dps.ny.gov/public/Common/ViewDoc.aspx?DocRefId={70B1E691-0000-C92C-882F-08E29400DA77}&DocTitle=JU%20TATF%20Report%2009-12-2024>

² For example, the “telematics provider” for at least one of the three vehicles tested in the TSWG EPRI Report reported a of “compensation” to account for “upstream losses and utilization specific for this EV.” See EPRI Report at 12-14.
